DAERA**

EXPORT OF OVINE SEMEN TO GB ON EHC 2116

OWNER DECLARATION

Name of Exporter:

Address:

Establishment number:

Movement History of ovine semen donor:

| Animal Identification number | Establishment number | Moved in date |
|-------------------------------------|-----------------------------|----------------------|
| | | |
| | | |
| | | |
| | | |

I, the operator of the above establishment, declare that as regards the donor above

- (a) *If imported I can provide a health certificate(s) to show that it has not previously been in an establishment that was not officially brucellosis-free.
- (b) Within 60 days before its stay in quarantine accommodation, the donor had a serological test for Brucellosis ovis (contagious epididymitis)
- (c) EITHER
*The donor was kept on a holding approved by DAERA (and not an approved semen collection centre) and within 28 days before collection, it had serological testing with negative results for:

Brucellosis (B melitensis)
Contagious epididymitis (B ovis)

For Border Disease: a virus isolation or antigen test and
a serological test to detect presence or absence of antibodies.

OR

*The donor ram moved from my establishment to an approved collection centre.

- (d) The donor animal *was /*was not vaccinated against foot-and-mouth disease in the 12-month period before the date of collection.
- (e) At the time of collection, the donor animal is not to be destroyed under a scheme to eradicate a contagious or infectious disease to which ovines are susceptible.
- (f) The donor animal comes from a holding not restricted for
Brucellosis
Rabies
Anthrax
- (g) The donor animal has not been in contact with cattle or pigs from a holding in a protection zone for foot and mouth disease, swine fever, brucellosis and Teschen disease.
- (h) At the time of collection, the donor animal and its holding are not subject to restrictions for the control of foot and mouth disease.
- (i) The donor animal is from a holding and has only been in contact with animals in the holding where the following diseases have not been diagnosed:
- Contagious agalactia of sheep in the previous 6 months
 - Paratuberculosis or caseous lymphadenitis in the previous 12 months
 - Pulmonary adenomatosis in the previous 3 years
 - *Maedi Visna in the previous 3 years and Caprine viral arthritis/encephalitis in the previous 3 years OR
 - *The donor was in a holding with other animals infected with Maedi Visna or caprine viral arthritis/encephalitis and these infected animals have been slaughtered and the remaining animals reacted negatively to two tests.
- (j) The donor animal is part of a scrapie monitored flock since birth or at least the last 2 years before oocyte/embryo collection and in which scrapie has not occurred in the 2 years before semen collection from the above donor.
- (k) *Rams used to produce embryos have come from a holding where no case of contagious epididymitis (*B. ovis*) has been diagnosed in the preceding 12 months.
- (l) *If the donor ram remained on my holding, it was not used for natural service for at least 30 days before collection.

*Indicates to delete whichever is not applicable.
