ABSTRACT

Capsule: Across Britain, breeding Eurasian Curlew *Numenius arquata* are less numerous and have shown greater population declines in areas with more arable farming, woodland cover and higher generalist predator abundance.

Aims: We present the first national-scale analysis of the potential drivers of Curlew population change in Britain, which is needed to guide conservation action for this globally near-threatened, declining species.

Methods: Breeding Bird Survey data and environmental predictors were used to model variation in Curlew abundance in 1995–99 and 2007–11, and population change between these periods.

Results: Arable farming and woodland cover were negatively associated with Curlew abundance and population declines. Curlew abundance was positively associated with extent of protected area coverage and gamebird numbers. Abundance and population change were positively associated with cooler temperatures and higher summer rainfall, but negatively associated with numbers of generalist predators.

Conclusions: We found support for the negative effects of intensive agriculture, forestry, increases in generalist predator populations and climate warming on Curlew abundance and population change. Effective site protection and measures to reduce generalist predator abundance may be important conservation measures, together with improving breeding habitat quality in the wider countryside.

Reasons for decline: **habitat change**

- Grazing
- Grassland improvement
- Agricultural intensification
- Bog drainage & peat extraction
- Vegetation change

Reasons for decline: **habitat change**

- Afforestation
 - displacement
 - edge effects
 - predator sources

Douglas et al. 2014 *J Applied Ecology*

² Pearce-Higgins et al. (2017) Bird Conservation International

Conclusions

- Rapid declines caused by
 - Land-use change
 - Predation pressure
 - Climate change

Conclusions

- We know what works for waders (?less so for curlew):
 - **Agri-environment schemes**
 - **Appropriate grazing levels**
 - **Manage water levels**
 - **Reduce losses through agricultural activity**
 - **Reduce predation**
 - **Nest protection**
 - **Predator control**
 - **Spatial planning for wind farms**

Conclusions

Moving forward

- **Work locally**
 - **Identify specific limitations**
 - **Test which solutions work where**
- **Identify the scale of intervention required for success.**
